

Nguyen Huu Hoang An

Site Reliability Engineer / System Engineer

Ho Chi Minh City, Vietnam | LinkedIn: <http://www.linkedin.com/in/nhhan>

PROFESSIONAL SUMMARY

System Engineer focused on cloud infrastructure, Linux systems, Docker-based platforms, and reliability engineering. Hands-on experience deploying and operating internal production services across AWS, GCP, and hybrid/on-prem environments, including authentication, VPN connectivity, high-availability application stacks, monitoring, backup automation, and security alerting. Strong interest in Kubernetes and cloud-native infrastructure, with practical EKS/GKE lab experience using KEDA and Karpenter, CI/CD exposure with Jenkins, GitLab CI, AWS CodePipeline, and ArgoCD, and observability experience with Prometheus, Grafana, Zabbix, and Uptime Kuma.

CORE SKILLS

Cloud & Infrastructure: AWS, GCP, Google Cloud, Cloudflare, Linux, Docker, High Availability Architecture, Backup Automation

Kubernetes & Delivery: Kubernetes, EKS/GKE labs, KEDA, Karpenter, ArgoCD, Jenkins, GitLab CI, AWS CodePipeline, Harbor

Monitoring & Observability: Prometheus, Grafana, Zabbix, Uptime Kuma, health checks, alerting, operational logs

Networking & Security: Netbird, VPN Architecture, Authentik, Google OAuth2, Nginx Proxy Manager, HAProxy, Security Groups, NACLs, GuardDuty, Security Hub, Detective

Data & Messaging: PostgreSQL, Redis, NocoDB, Kafka, RabbitMQ, Trino, StarRocks, Elasticsearch, Kibana

AI & Automation Tooling: Flowise, N8N, Google AI Studio, Codex, Claude, MCP, Codex

Languages & Communication: English IELTS Academic 6.0

WORK EXPERIENCE

Antsomi - System Engineer

Ho Chi Minh City, Vietnam | 2024 - Present

Domain: Marketing Technology, Customer Data Platform for Personalized Marketing

- Build and operate internal infrastructure services for authentication, VPN access, workflow automation, monitoring, backups, and cloud security research.
- Deploy Docker-based services with attention to high availability, recovery, operational visibility, and secure access control.
- Collaborate with infrastructure, data, and business teams to reduce manual operations and improve internal service reliability.

Centralized Authentication With Google Workspace

Technologies: Docker, Authentik, Google Cloud, Google OAuth2, Nginx Proxy Manager, PostgreSQL

- Implemented centralized authentication using Authentik and Google OAuth2 to manage user access across internal apps and services.
- Integrated Google Workspace identities to reduce repetitive user creation and simplify access management for the Infrastructure team.
- Added daily backups, health checks, operational logging, and Google Chat alerts for authentication and authorization events.
- Improved visibility into user management and service health through clearer activity logging and notification workflows.

VPN Infrastructure With Netbird

Technologies: Docker, Netbird, Authentik, Uptime Kuma, PostgreSQL

- Built a manageable VPN platform with Netbird to connect users and internal resources across local networks, data centers, AWS, and GCP-like environments.
- Integrated Authentik authentication so users authenticate before accessing VPN-protected resources.
- Implemented monitoring, automated backup lifecycle scripts, and Uptime Kuma checks for VPN-related services.
- Helped the Infrastructure team operate VPN connectivity through a UI-driven workflow that is easier to understand and maintain.

High-Availability Workflow Platform

Technologies: Docker, Docker Compose, N8N, Flowise, HAProxy, Authentik, PostgreSQL

- Deployed N8N and Flowise using a stateless Docker Compose architecture behind HAProxy.
- Separated application containers from persistent PostgreSQL and data layers to support horizontal scaling and safer recovery.
- Integrated Authentik authentication and Netbird access controls for internal workflow services.
- Added database backup strategies and service-health monitoring for reliability.
- Supported data and analytics teams by enabling workflow scheduling, faster campaign/report execution, and AI-assisted automation.

Cloud Security, Cost, and Kubernetes Labs

- Researched and implemented AWS security services including Security Groups, NACLs, GuardDuty, Security Hub, Detective, and AWS Config.
- Set up cloud notifications and account-level cost alerts across AWS and GCP accounts.
- Explored AWS Marketplace delivery with the team for bringing products to market.
- Designed experimental EKS/GKE clusters with autoscaling using KEDA and Karpenter.
- Continued building Kubernetes operations depth, with a focus on highly available service deployment and CKA preparation.
- Used Google AI Studio and other AI tools to help handle support requests from non-coding teams.

SELECTED TECHNICAL FOCUS

- Reliability: health checks, backup automation, alerting, operational logging, and stateless service design.
- Cloud-native: Docker, Kubernetes labs, autoscaling concepts, CI/CD, ArgoCD, and container registry workflows.
- Security: identity integration, VPN access control, cloud security services, and audit-friendly user management.
- Startup readiness: comfortable learning quickly, owning operational problems, and improving systems with limited process overhead.

EDUCATION

VNUHCM - University of Science

Ho Chi Minh City, Vietnam

CERTIFICATIONS

- AWS Solutions Architect certification, Aug 2024
- IELTS Academic 6.0, 2022
